

List of output variables for atmospheric models

Authors: Andrea Montani & WG-DI members

Version 4.0 as of 20 February 2007

Adapted by: Manfred Dorninger, 7 October 2014

Following is the (TIGGE-inspired) list of variables originally set-up for D-PHASE atmospheric models. We will use this list as starting point of our discussion for variables to be stored for model reruns within MesoVICT. Selected variables in the list below are necessary to compare with VERA variables.

Model types:

Since different types of models need to provide different variables, we divide the models into

- high-resolution deterministic models (“high-res”; mesh-size $O(1\text{-}3\text{km})$);
- deterministic models driving the high-resolution deterministic models (“driving models” or “dri”);
- and ensemble prediction systems (“ensembles” or “ens”).

Single level fields

For MesoVICT only single level (surface) fields are regarded from the models. For upper level fields on model levels or pressure levels contact WDCC in Hamburg for the old model runs and the data provider for the new model runs on a bilateral basis.

Domains:

Model output should be provided for the **VERA domain (41 to 55 N, -2 to 20 E)**, that is, models with a bigger computational domain are requested to restrict their output to the VERA domain, whereas models with a smaller computational domain should provide output for the full domain. If this is not possible smaller domains will be accepted as long as the domain will cover the whole Alpine region and it is in the centre of the model domain.

Data format:

GRIB1

Naming convention for output files:

`<INIDATE(10)>_<DOMAIN(4)>_<MODEL(8)>_<ENSNR(3)>_<TYPE(4)>_D.grb`

where

- INIDATE: YYYYMMDDHH (in UTC), initial time of the forecast
- DOMAIN: "VERA" (only this allowed)
- MODEL: e.g. COSMOCH7, CLEPS, ... (maximal 8 characters, less are ok)
- ENSNR: EXX, i.e. E01, E02, ..., E16, ... for 16 or more ensemble members. The ensemble mean is named "E00". <ENSNR> is left out for deterministic models.
- TYPE:
 - "FIX" : constant fields (marked by "once" in the table below),
 - "TPT2": tot_prec, t_2m,
 - "SURF": all single-level fields,

FIX will be provided only once, while the other TYPES have to be provided for each forecast.

D stands for data.

Abbreviations:

high-res:	high-resolution deterministic models
dri:	driving models
ens:	ensembles
Acc:	Accumulation
inst:	instantaneous output
det_lo:	determined over period from last output time to current output time
acc_st:	accumulated over period from start of forecast to current output time
avg:	averaged over the forecast period

Single level fields

Variable	output time steps			Acc	Variable number	Table number	Variable for MesoVICT necessary
	high-res	dri	ens				
Pressure at mean sea level (Pa)	1h	1h	1h	inst	002	002	x
Pressure at the surface (Pa)	1h	1h	1h	inst	001	002	x
